

JavaScript Validation Report – JSLint

Issue:

All JavaScript files initially triggered JSLint warnings due to ES6 syntax, including `const` declarations and arrow functions (`=>`). By default, JSLint does not support ES6, causing it to flag these features as invalid.

Solution:

Adding the configuration option:

```
{  
  "esversion": 6  
}
```

enables ES6 support in JSLint. After applying this, all warnings, errors, and informational messages related to ES6 features were eliminated, making the code fully compliant.

Affected Files:

- `pages.js` (App: Pages)
- `products/products.html` (App: Products)
- `profiles.js` (App: Profiles)
- `base.js` (App: Static JS)
- `qty_update.js` (App: Static JS)

Outcome:

After enabling `"esversion": 6`, JSLint validated all files successfully with no errors or warnings, ensuring modern ES6 syntax compliance and clean, standards-ready JavaScript code.
